## A Fallacy

The following is the proof of the theorem that every triangle is isosceles.

Given:  $\triangle ABC$ 

**To Prove:** AB = AC.

**Proof:** Let D be the midpoint of BC such that DB = DC and AD  $\perp$  BC.

Now DB = DC, AD = AD and  $\angle ADB = \angle ADC$ 

Hence  $\triangle ADB \cong \triangle ACD$  (SAS)

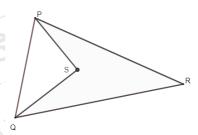

Therefore, AB = AC (c.p.c.t)

Can you find the fallacy?

## Fun Corner - Do you know your birthday?

You could hardly be expected to remember the day itself, although you know your date of birth. Here is an easy method for you to calculate.

- 1. Let **Y** be the year in which you were born
- 2. Let **D** be the day of the year you were born
- 3. Calculate X = (Y-1)/4 and ignore the remainder
- 4. Find S = Y + D + X
- 5. Divide **S** by **7** and note the remainder

The day on which you were born can now be deduced by using the table below to see which day corresponds to the remainder:

Remainder	0	1	2	3	4	5	6
Birthday	Fri	Sat	Sun	Mon	Tue	Wed	Thur

*For example:* Suppose the date of birth is 2<sup>nd</sup> March 2008

- 1. Y = 2008
- 2. January = 31 days, February = 29 days (2008 is a leap year), March = 2days, so D=62
- 3. X = (2008 1)/4 = 501 ignoring the remainder
- 4. S = 2008 + 62 + 501 = 2571
- 5.  $2571 \div 7$  gives the remainder 2. Using the table, a remainder 2 indicates the birth day is Sunday.

## Fun with Math - Tower Of Brahma

Tower of Brahma in a temple in the Indian city of Bananas. This tower, the description reads, consists of 64 disks of gold, now in the process of being transferred by the temple priests. Before they complete their task, it was said, the temple will crumble into dust and the world will vanish in a clap of thunder. The disappearance of the world may be questioned, but there is little doubt about the crumbling of the temple. The formula  $2^{64}-1$ , yields the 20-digit number 18,446,744,073,709,551,615. If the priests worked night and day, moving one disk every second, it would take them many thousands of millions of years to finish the job.

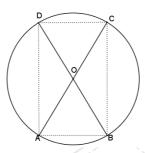

If we consider a tower of three disks only, then the number of moves will be  $2^3 - 1 = 7$ . So, it can be solved by moving the disks in the following order: ABACABA

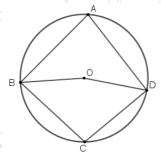

If we consider a tower of four disks, then the number of moves will be  $2^4 - 1 = 15$  i.e. ABACABADABACABA

#### **Fun with Math - The Three Jesters**

Among the prime numbers the three consecutive prime numbers 7,11,13 seem to possess some quite amusing properties. Hence, they are named as The three jesters. Addition of these numbers gives primes and they can bring back to your original number.

Take any three-digit number, say 123. Now let us write the same number to its right side to have a six-digit number. Then this case we will have 123123. Now any such six-digit number when divided by 7,11 and 13 will give you back your original three-digit number.

Relation with clock and calendar:

- a. 11+13 = 24 = Number of hours which make a day
- b. 7 = no. of days which make a week
- c. 7 + 11 + 13 = 31 no. of days which make a month
- d. Average of 11 and 13 = 12 = no. of months which make a year.

#### Puzzle corner

Connect the dots: Without lifting your pencil, connect 16 dots using 6 straight line segments

#### Answer: Which is for real? Base two to the rescue.

Place on the scale 1 coin from the 1<sup>st</sup> stack 2 from the 2<sup>nd</sup> stack, 4 from the 3<sup>rd</sup> stack, 8 from the 4<sup>th</sup> stack and 16 from the 5th stack. We know if all stacks are real the weight should be 31 grams. So, suppose the weight is 49 grams, for example. Writing the amount over 31, that is 18 grams, in base two we get 10010. So, this means the counterfeit coins came from the stacks from which you took 16 coins and 2 coins.

# **Math Magic Trick**

Here is a cool **Math Magic Trick** that kids can use to impress family and friends and build basic math skills too! You will find lots of other math tricks here as well so have fun and learn some math along the way.

Materials: 5 dice

#### **Performing the Trick:**

- 1. Tell the spectator that you can *see through the dice* all the way to the bottom numbers.
- 2. Roll all 5 dice on table.
- 3. Pretend that you are looking through the dice to see the bottom numbers. (What you are doing is adding up the top numbers of all 5 dice.)

- 4. Then you will announce the sum of the bottom numbers. (All you must do is subtract the sum of the numbers you added in your mind from the top from 35.)
- 5. Then turn over the 5 dice and have the spectator add the numbers of top numbers. They will be amazed at how you did it!

Can you Figure out the trick?
